

Geoffrey Gorer

The Pornography of Death

*"Birth, and copulation, and death.
That's all the facts when you come to brass tacks;
Birth, and copulation, and death."*

T. S. Eliot. SWEENEY AGONISTES (1932)

PORNOGRAPHY is, no doubt, the opposite face, the shadow, of prudery, whereas obscenity is an aspect of seamliness. No society has been recorded which has not its rules of seamliness, of words or actions which arouse discomfort and embarrassment in some contexts, though they are essential in others. The people before whom one must maintain a watchful seamliness vary from society to society: all people of the opposite sex, or all juniors, or all elders, or one's parents-in-law, or one's social superiors or inferiors, or one's grandchildren have been selected in different societies as groups in whose presence the employment of certain words or the performance of certain actions would be considered offensive; and then these words or actions become charged with effect. There is a tendency for these words and actions to be related to sex and excretion, but this is neither necessary nor universal; according to Malinowski, the Trobrianders surround eating with as much shame as excretion; and in other societies personal names or aspects of ritual come under the same taboos.

Rules of seamliness are apparently universal; and the non-observance of these rules, or anecdotes which involve the breaking of the rules, provoke that peculiar type of

laughter which seems identical the world over; however little one may know about a strange society, however little one may know about the functions of laughter in that society (and these can be very various) one can immediately tell when people are laughing at an obscene joke. The topper of the joke may be "And then he ate the whole meal in front of them!" or "She used her husband's name in the presence of his mother!" but the laughter is the same; the taboos of seamliness have been broken and the result is hilarious. Typically, such laughter is confined to one-sex groups and is more general with the young, just entering into the complexities of adult life.

Obscenity then is a universal, an aspect of man and woman living in society; everywhere and at all times there are words and actions which, when misplaced, can produce shock, social embarrassment, and laughter. Pornography on the other hand, the description of tabooed activities to produce hallucination or delusion, seems to be a very much rarer phenomenon. It probably can only arise in literate societies, and we certainly have no records of it for non-literate ones; for whereas the enjoyment of obscenity is predominantly social, the enjoyment of pornography is predominantly private. The fantasies from

which pornography derives could of course be generated in any society; but it seems doubtful whether they would ever be communicated without the intermediary of literacy.

The one possible exception to this generalisation is the use of the plastic arts without any letterpress. I have never felt quite certain that the three-dimensional *poses plastiques* on so many Hindu temples (notably the "Black Pagoda" at Konarak) have really the high-falutin Worship of the Life Force or Glorification of the Creative Aspect of Sex which their apologists claim for them; many of them seem to me very like "feelthy" pictures, despite the skill with which they are executed. There are too the erotic woodcuts of Japan; but quite a lot of evidence suggests that these are thought of as laughter-provoking (i.e. obscene) by the Japanese themselves. We have no knowledge of the functions of the Peruvian pottery.

As far as my knowledge goes, the only Asiatic society which has a long-standing tradition of pornographic literature is China; and, it would appear, social life under the Manchus was surrounded by much the same haze of prudery as distinguished the 19th century in much of Europe and the Americas, even though the emphasis fell rather differently; women's deformed feet seem to have been the greatest focus of peeping and sniggering, rather than their ankles or the cleft between their breasts; but by and large life in Manchu China seems to have been nearly as full of "unmentionables" as life in Victoria's heyday.

PORNOGRAPHY would appear to be a concomitant of prudery, and usually the periods of the greatest production of pornography have also been the periods of the most rampant prudery. In contrast to obscenity, which is chiefly defined by situation, prudery is defined by subject; some aspect of human experience is treated as inherently shameful or abhorrent, so that it can never be discussed or referred to openly, and experience of it tends to be clandestine and accompanied by feelings of guilt and unworthiness. The unmentionable aspect of ex-

perience then tends to become a subject for much private fantasy, more or less realistic, fantasy charged with pleasurable guilt or guilty pleasure; and those whose power of fantasy is weak, or whose demand is insatiable, constitute a market for the printed fantasies of the pornographer.

Traditionally, and in the lexicographic meaning of the term, pornography has been concerned with sexuality. For the greater part of the last two hundred years copulation and (at least in the mid-Victorian decades) birth were the "unmentionables" of the triad of basic human experiences which "are all the facts when you come to brass tacks," around which so much private fantasy and semi-clandestine pornography were erected. During most of this period death was no mystery, except in the sense that death is always a mystery. Children were encouraged to think about death, their own deaths and the edifying or cautionary death-beds of others. It can have been a rare individual who, in the 19th century with its high mortality, had not witnessed at least one actual dying, as well as paying their respect to "beautiful corpses"; funerals were the occasion of the greatest display for working class, middle class, and aristocrat. The cemetery was the centre of every old-established village, and they were prominent in most towns. It was fairly late in the 19th century when the execution of criminals ceased to be a public holiday as well as a public warning. Mr. Fairchild had no difficulty in finding a suitably garnished gibbet for his moral lesson.

In the 20th century, however, there seems to have been an unremarked shift in prudery; whereas copulation has become more and more "mentionable," particularly in the Anglo-Saxon societies, death has become more and more "unmentionable" *as a natural process*. I cannot recollect a novel or play of the last twenty years or so which has a "death-bed scene" in it, describing in any detail the death "from natural causes" of a major character; this topic was a set piece for most of the eminent Victorian and Edwardian writers, evoking their finest prose and their most elaborate technical effects to produce the

greatest amount of pathos or edification.

One of the reasons, I imagine, for this plethora of death-bed scenes—apart from their intrinsic emotional and religious content—was that it was one of the relatively few experiences that an author could be fairly sure would have been shared by the vast majority of his readers. Questioning my old acquaintances, I cannot find one over the age of sixty who did not witness the agony of at least one near relative; I do not think I know a single person under the age of thirty who has had a similar experience. Of course my acquaintance is neither very extensive nor particularly representative; but in this instance I do think it is typical of the change of attitude and “exposure.”

THE natural processes of corruption and decay have become disgusting, as disgusting as the natural processes of birth and copulation were a century ago; preoccupation about such processes is (or was) morbid and unhealthy, to be discouraged in all and punished in the young. Our great-grandparents were told that babies were found under gooseberry bushes or cabbages; our children are likely to be told that those who have passed on (fie! on the gross Anglo-Saxon monosyllable) are changed into flowers, or lie at rest in lovely gardens. The ugly facts are relentlessly hidden; the art of the embalmers is an art of complete denial.

It seems possible to trace a connection between the shift of taboos and the shift in religious beliefs. In the 19th century most of the inhabitants of Protestant countries seem to have subscribed to the Pauline beliefs in the sinfulness of the body and the certainty of the after-life. “So also is the resurrection of the dead. It is sown in corruption; it is raised in incorruption: it is sown in dishonour; it is raised in glory.” It was possible to insist on the corruption of the dead body, and the dishonour of its begetting, while there was a living belief in the incorruption and the glory of the immortal part. But in England, at any rate, belief in the future life as taught in Christian doctrine is very uncommon today even in the minority who

make church-going or prayer a consistent part of their lives; and without some such belief natural death and physical decomposition have become too horrible to contemplate or to discuss. It seems symptomatic that the contemporary sect of Christian Science should deny the fact of physical death, even to the extent (so it is said) of refusing to allow the word to be printed in the *Christian Science Monitor*.

During the last half-century public health measures and improved preventive medicine have made natural death among the younger members of the population much more uncommon than it had been in earlier periods, so that a death in the family, save in the fullness of time, became a relatively uncommon incident in home life; and, simultaneously, violent death increased in a manner unparalleled in human history. Wars and revolutions, concentration camps and gang feuds were the most publicised of the causes for these violent deaths; but the diffusion of the automobile, with its constant and unnoticed toll of fatal accidents, may well have been most influential in bringing the possibility of violent death into the expectations of law-abiding people in time of peace. While natural death became more and more smothered in prudery, violent death has played an ever-growing part in the fantasies offered to mass audiences—detective stories, thrillers, Westerns, war stories, spy stories, science fiction, and eventually horror comics.

There seem to be a number of parallels between the fantasies which titillate our curiosity about the mystery of sex, and those which titillate our curiosity about the mystery of death. In both types of fantasy, the emotions which are typically concomitant of the acts—love or grief—are paid little or no attention, while the sensations are enhanced as much as a customary poverty of language permits. If marital intercourse be considered the natural expression of sex for most of humanity most of the time, then “natural sex” plays as little rôle as “natural death” (the ham-fisted attempts of D. H. Lawrence and Jules Romains to describe “natural sex” realistically but high-mindedly prove the

rule). Neither type of fantasy can have any real development, for once the protagonist has done something, he or she must proceed to do something else, with or to somebody else, more refined, more complicated, or more sensational than what had occurred before. This somebody else is not a person; it is either a set of genitals, with or without secondary sexual characteristics, or a body, perhaps capable of suffering pain as well as death. Since most languages are relatively poor in words or constructions to express intense pleasure or intense pain, the written portions of both types of fantasy abound in onomatopœic conglomerations of letters meant to evoke the sighs, gasps, groans, screams, and rattles concomitant to the described actions. Both types of fantasy rely heavily on adjective and simile. Both types of fantasy are completely unrealistic, since they ignore all physical, social, or legal limitations, and both types have complete hallucination of the reader or viewer as their object.

THERE seems little question that the instinct of those censorious busybodies preoccupied with other people's morals was correct when they linked the pornography of death with the pornography of sex. This, however, seems to be the only thing which has been correct in their deductions or attempted actions. There is no valid evidence to suppose that either type of pornography is an incitement to action; rather are they substitute gratifications. The belief that such hallucinatory works would incite their

readers to copy the actions depicted would seem to be indirect homage to the late Oscar Wilde, who described such a process in *The Portrait of Dorian Gray*; I know of no authenticated parallels in real life, though investigators and magistrates with bees in their bonnets can usually persuade juvenile delinquents to admit to exposure to whatever medium of mass communication they are choosing to make a scapegoat.

Despite some gifted precursors, such as Andréa de Nerciat or Edgar Allen Poe, most works in both pornographies are aesthetically objectionable; but it is questionable whether, from the purely æsthetic point of view, there is much more to be said for the greater part of the more anodyne fare provided by contemporary mass media of communication. Psychological Utopians tend to condemn substitute gratifications as such, at least where copulation is involved; they have so far been chary in dealing with death.

Nevertheless, people have to come to terms with the basic facts of birth, copulation, and death, and somehow accept their implications; if social prudery prevents this being done in an open and dignified fashion, then it will be done surreptitiously. If we dislike the modern pornography of death, then we must give back to death—natural death—its parade and publicity, re-admit grief and mourning. If we make death unmentionable in polite society—"not before the children"—we almost ensure the continuation of the "horror comic." No censorship has ever been really effective.

Sir John Cockcroft

The Future of Atomic Energy

TO MANY of us this Conference has been a celebration of a very great achievement of the scientific world—the harnessing of the energy of atomic nuclei to serve the future needs of man. This is the culmination of scientific work of men of genius in many nations. It is fitting therefore that representatives of the great majority of countries should have come together to present their contributions to this work and to discuss how this new source of power can help the future development of their countries and the whole human race.

We have had described to us the first experimental atomic power stations and have heard that they are working well. We have also heard of the rapid progress of construction of the first full-scale nuclear power stations. Within two years they will be delivering very substantial amounts of electricity to industry and we will begin to gain experience in their operation and economics. These early stations will be closely followed by successors of different and generally improved designs, so that within five years we are likely to have at least ten nuclear power stations generating up to 200 megawatts in a single unit operating in different parts of the world.

These will all be pioneering or demonstra-

tion stations built to test the technology on which all depends, and to compare the relative advantages of the ten most promising types both from the point of view of economics and also of reliability and safety in operation. So most of the next decade will be occupied in laying a sound basis from which nuclear power can expand rapidly to become in the end the major power source of the world. Until we have achieved a satisfactory operating experience we will not be justified in embarking on a more rapid expansion.

However, this new industrial development has the advantage of a very great and unparalleled concentration of scientific and engineering ability driving it forward with imagination and enthusiasm—as you can judge from the papers which have been presented to this Conference. So the speed of development will be rapid and the nuclear power stations of 1970 will look as different from those of 1957 as the modern motor car differs from the Model T Ford.

Uranium for Coal

THE papers presented to the Conference have shown that we must not expect the cost of nuclear power to be cheaper in the next decade than power from coal. The consensus of opinion is that capital costs will be

This article is the text of Sir John Cockcroft's address to the United Nations Conference on Atomic Energy in Geneva.
